915gm drivers available: The 915GM was a version of the X3100 running on the latest Intel 915GM chipset. The acceleration features provided by the chip are similar to those of the 845GME, but with the addition of support for the Eyefinity technology. Intel released driver updates on October 20, 2006. In addition, Compaq will support this chip with drivers available in October 2006. The 915GM chipset was tested with the Release Candidate 2 (RC2) of X3100 under Linux 2.6.24-rc2 kernel. The 945GME chipset was released on November 21, 2006. Nitric oxide (NO) has been shown to play a critical role in liver fibrosis and cancer. Expression of cytochrome P450 4C39 (CYP4C39) was reported to be up-regulated in hepatocellular carcinoma (HCC). In this study, we aimed to determine the effects of NO-mediated apoptotic signaling on CYP4C39 (Dtk-15) expression and to investigate the role of CYP4C39 in NO-mediated cytotoxicity in HCC cells. HCC cells were exposed to various NO donor compounds. Nitric oxide production was analyzed using the fluorescent dye DAF-FM. CYP4C39 expression was assessed by real-time PCR and Western blot. The role of CYP4C39 in NO-mediated cytotoxicity was determined using Dtk-15 siRNA knockdown. In NO donor-treated HCC cells, the expression of CYP4C39 was significantly induced. NO donor-induced cytotoxicity was shown to be mediated by NO and involved NO-induced ROS, activation of the MAPK and caspase-3 pathway, and apoptotic cell death. CYP4C39 knockdown reversed the cytotoxicity of NO donor compounds in HCC cells, suggesting that CYP4C39 was involved in NO-mediated apoptotic signaling. We show 82157476af
